3715. CHEMICAL COMPOSITION OF TAR WATER FROM SHALES IN THE BALTIC DEPOSIT. Ivanov, B.I. and Sharonova, N.S. (Trud. Vsesoyuz. nauch.-issled. Inst. Pererab. Slan. (Proc. Inst. Treat. Shale, U.S.S.R.), 1954, (2), 161-188; abstr. in Ref. Zh. Khim. (Ref. J. Chem., Moscow), 1956, (8), 23268). *Encl* 2
An examination was made of the composition of organic impurities in the tar water resulting from the low-temperature carbonisation of Baltic oil shales in tunnel kilns. The following were separated by fractional distillation: formic, acetic propionic and butyric aldehydes, methyl ethyl ketone. The following volatile organic acids were found in the tar water: formic, acetic, propionic and n-butyric acids and acetonitrile. Examination of a mixture of monohydric and multihydric phenols showed that monohydric phenols consist largely of cresols, while the multihydric are mainly derivatives of resorcin. The bases in the tar water contain mainly ammonia and pyridine, and also several substituted pyridines: alpha-nicotine, lutidine and collidine.

TITLE:

Investigation of the Conditions of the Origin and Development
of the Pitting Corrosion of Iron (Issledovaniye usloviy
vozniknoveniya i razvitiya pittingovoy korrozii zheleza)

PERIODICAL:

Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 1, pp 208-212
(USSR)

ABSTRACT:

In contrast to the usual corrosion, the pitting corrosion
proceeds in the form of patches (Refs 1-9); the corrosion
spots are, however, not formed by impurities (Ref 8). In order
to investigate this case the mechanism of the corrosion cells,
produced by oxygen, has to be investigated as well as the
growth mechanism of these corrosion spots. These problems were
investigated by tests with various aqueous solutions. Iron
samples were tested with 0.29% C, 0.01% Si, 0.42% Mn, 0.019% P,
and 0.039% S and photographs taken. The tests were conducted
at 60° with various salt solution combinations (NaCl, $K_2Cr_2O_7$,
KCl, $NaNO_2$, $Ca(NO_3)_2$) and HCl and KOH solutions at varying
periods of treatment (Figs 1-10). In the presence of

Card 1/2

Investigation of the Conditions of the
Origin and Development of the Pitting Corrosion of Iron

SOV/76-33-1-35/45

oxidizing agents the corrosion is determined by the diffusion velocity of these depolarizers towards the metallic surface. In these cases the current intensity does not depend on the electrode potential, the latter, however, can attain various values. The formation of various potential differences is obviously favored in such cases and the differences bring about the pitting corrosion. The occurrence of local potential differences on mercury electrodes was also observed by A. V. Frumkin and B. P. Bruns. The presence of a passivator, the amount of which is not sufficient for passivating the surface (e.g. NaNO_2), in the solution may also favor a pitting corrosion. It is assumed that the autocatalytic character of the development of the pitting corrosion spots can be explained by the formation of insoluble corrosion products and the occurrence of differential aeration (Ref 4). There are 10 tables and 16 references, 12 of which are Soviet.

TITLE: Industrial use of steels with lowered nickel content

SOURCE: Khimicheskaya promyshlennost', no. 7, 1964, 541-547

TOPIC TAGS: stainless steel, low nickel stainless steel, EP53 stainless steel, EP54 stainless steel, steel composition, steel microstructure, steel mechanical property, steel corrosion resistance, steel weldability, weld metal property, stainless steel corrosion

ABSTRACT: To determine the suitability of low-nickel stainless steels for use in the chemical industry, the corrosion resistance of OKh21N5T (EP-53) and OKh21N6M2T (EP-54) stainless steels has been investigated under laboratory, semi-industrial, and industrial conditions. These specimens, with joints made by means of manual or submerged arc welding, were tested in nitric acid with concentrations of 2-80% at temperatures of 40, 60, and 80C. Metallographic examination of the

✓ 9714. Acetylation of p-aminobenzoic acid and oxaloacetic acids in tissues of healthy organisms and those with malignant tumours. A. V. Trufanov and K. S. Sharokhova *Biokhimiya*, 1983, 18, 789-792; *Refers: Zh. bio. Khim.*, 1983, Abstr. No. 13843. — For the period 18–30 days after induction of M¹ sarcoma, rats were injected with p-aminobenzoic acid (PAB) at 5 mg/kg; 24 hr. urine samples were estimated for free PAB and its acetyl deriv. After 5 days the same animals were given 5 mg/kg. of PAB + 0.8 mg. Ca pantothenate. Normal animals served as controls. Acetylated PAB was the same in the healthy and tumour bearing animals but on addition of Ca pantothenate a considerable increase of the acetylated compound took place in the latter group only. Liver homogenates of rats with sarcoma 45 failed completely to acetylate PAB under conditions in which homogenates of livers of normal animals gave intensive acetylation. Intensity of acetylation of oxaloacetic acid was also lowered in homogenates of livers of rats with sarcoma 45. (Russian)

TITLE: A device for measuring phase shift. Class 21, No. 178416

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1966, 36

TOPIC TAGS: phase shift, ~~measuring apparatus~~, electromagnetic converter, *electronic test equipment*

ABSTRACT: This Author Certificate presents a device for measuring phase shift between two voltages. The device includes an electromagnetic converter, a scale, and a light source (see Fig. 1). The design makes the measurements independent of a change in the amplitude and of the frequency of the voltages being compared. The converter is in the form of two synchronized motors connected to the sources of the voltages being compared. Each motor rotates (in the same direction) two coaxial positioned cylinders. One cylinder has a right-hand spiral groove, and the other has a left-hand spiral groove. A light source is placed inside the cylinders and a scale is located on the outer wall of the cylinders. The light beam marker, corresponding to the point of intersection of the two spiral grooves,

A. N. Severtsov, Acad Sci USSR, 24 pp

"Dok Ak Nauk SSSR" Vol LXI, No 3

In 1946, an expedition from the Paleontol Inst, Acad
Sci USSR, found impressions which were at first taken
for insect larvae. Rodendorf identified them as
representatives of the order Thysanura and turned
them over to Sharov for detailed study and description.
Sharov classifies them as part of a new family,

TITLE

Peculiar Paleozoic Wingless Insects Belonging to the new Order Monura (Insecta, Apterygota).
(Svoyeobraznyye paleozoyskiye beskrylyye nasekomye novogo otryada Monura (Insecta, Arterygota.)

PERIODICAL

Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 4, pp. 795-798 (USSR)

ABSTRACT

In 1949 an uncertain fossil remainder of an abdomen was found in Kaltan (Kuznetsk basin, right bank of the Kondoma, village of Verkhniy Kaltan, district of Kuzdeyev, reriitory of Kemerovo). The fossil remains found in 1951, 1954 and 1955 were fragmentary. In 1956 the author found at the same place 25 of these fossil remains, some of whom were in the best state of conservation. Their study brought the author to the conclusion that they belong to a species of a new order of insects which is related to the thysanorae and which was described by Brongniart more than 70 years ago as Dasyleptus lucasi. Handlirsch partially classified it with the spiders (order Thelyphonida) and probably with primitive fossil Crustaceae. Due to Handlirsch's authority his opinions were never doubted. In spite

CARD 1/3

Monura (Insecta, Apterygota).

of the bad state of conservation of the specimen by Brognart it can be concluded with certainty that the below-described Anthropoda belongs to the same order, family, and even to the same species as D. lucasi. At the same time there exists no doubt that these Anthropoda are primary-wingless insects. A detailed description of the new order Monura, the new family Dasyleptidae and the new species D. Brongniart from Kaltan is given. The geological age of the latter new species, resp. of the pertinent layers, is considered as Lower Permian by Martynova. Becker-Migdisova thinks that these layers either correspond to the lower parts of the Kungur stage or to the upper layers of the Artin stage. The finding of a representative of the species Dasyleptus indicates the presence in these layers of relict forms which are characteristic of the Upper Carboniferous fauna of Western Europe. There are 3 figures and 3 Slavic references.

AUTHOR: Sharov, A. G. SOV/20-122-4-55/57

TITLE: On the Structure of the Limbs and the Manner of Locomotion
of the Monura and Thysanura (Insecta, Apterygota)
(О структуре конечностей и способе передвижения Monura
и Thysanura (Insecta, Apterygota)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 4, pp 733-736
(USSR)

ABSTRACT: The extreme primitiveness of the limbs was briefly mentioned
by the same author when he described the new order Monura
(Ref 3). These insects are based upon the pretarsus. The
articulation of the legs of Dasyleptus (Fig 1 a) reminds of
that of different "centipedes". With Monura the presence of
a large subcoxal limb is outstanding which is almost entirely
isolated from the pleural area. To judge from the latter
phenomenon this limb has the shape of a closed ring which is
narrower at the side nearer to the middle line of the body
(Fig 1 a). A similar limb in Thysanura (Refs 8, 9) was first
looked upon as a subcoxal one by Snodgrass but later
recognized as a pleural one. Here it is more closely connected
with the pleural area; therefore, the coxal limb with its

Card 1/4

On the Structure of the Limbs and the Manner of SSV/20-122-4-55/57
Locomotion of the Monura and Thysanura (Insecta, Apterygota)

inner side is directly adjacent to the pleural area of the thoracic segment. In the alated insects trochantine is apparantly a remainder of the subcoxal limb. The author confirms Snodgrass's subcoxal theory only with respect to the fact that the basal parts of the limbs are displaced into the pleural area during the course of the evolutionary development of the insects: however, the author refuses to accept the concrete aspect of Snodgrass's theory - namely the homology of some parts of the pleural skeleton with different segments of the subcoxal limb. Particularly it cannot be maintained that the anapleurit, from which later on the episternum and the epimeron develop, is homologous with part of the subcoxal limb; for in Lepisma (Ref 2) the epimeron and the episternum are present apart from the subcoxa. If the limbs of Monura and Thysanura are homologized with those of the Crustacea, the anapleurit (episternum and epimeron) of the insects is not to be homologized with any basal part of the leg, but with the laterotergite (pleurit); in that case the subcoxal limb is homologous with the coxopodite, the coxal limb with the basipodite, whereas the stylus on the latter limb is homologous with the exopodite

Card 2/4

On the Structure of the Limbs and the Manner of SOV/20-122-4-55/57
Locomotion of the Monura and Thysanura (Insecta, Apterygota)

at the basipodite. The trochanter is homologous with the ischiopodite, the thigh with the meropodite, The tibia with the carpopodite, the tarsus with the propodite and finally the pretarsus with the dactylopodite. The particularities in the structure of the leg and its different members show that in the case of Dasyleptus (Monura) the position of the legs in relationship to the body corresponded to that given in figure 1. The relation of the different limbs and the entire configuration of the legs of the Monura is characteristic of the most primitive stage of development of the thoracic limbs of insects. The presumable further process of evolution is described. Finally the structure and the development of the caudal part of Monura, Thysanura and Ephemeroptera is discussed. There are 2 figures and 10 references, 4 of which are Soviet.

ABSTRACT: An engineer since 1929, A. B. Chernin has worked for years in developing new techniques and equipment for relay protection of electric power systems. In this 60th birthday tribute, he is credited with leading the group which produced the directives on relay protection, contributing to the development of a method for calculating transient processes in long distance 400-500 kv power transmission lines and with aiding in planning of the electric portions of power stations, substations and power systems. The results of his engineering and scientific work have been published 46 times, he is a doctor of technical sciences (since 1963), and has taught for 30 years at the Moscow Power Institute. ABSTRACT: B. S. Uspenskiy was born in June 1906. He graduated from
 the State Electric Machine Building Institute in 1928 as an electric
 installation engineer. He worked in the State Electro-Technical Trust
 for four years, then in the All-Union ElectroTechnical Union, where he
 planned power construction units. Plans which he made up at that time
 for the electrical portion of electrical stations and sub-stations are
 still being used. He was involved in planning and installation of the
 electrical portion of hydro-electric power stations and powerful pumping
 stations in the Moscow-Volga Canal. During the war, he was in charge in
 installation of the Krasnogorskaya Heat and Electric Power Station, the
 planning of the Urals Hydro-Electric Power Station and other projects. He
